Problem Statement:

Railways are an important aspect of daily life for many people as it is used as transport to work and home for many citizens all across the country. With the rail network being as prevalent as it is in modern society, it is important to ensure that every person has an equal access to fair rail service.

This project will take in the data of trains that have previously travelled through an area and compare that data to the SLOA index of the surrounding areas to work out if there is a correlation between the deprivation of an area and the quality of it’s rail service.
